FACULTY

Michael Ehmann, MD MPH MS FACEP

PRESENTATION

Contrast Controversies: Contrast Media & Acute Kidney Injury

DESCRIPTION

Take a critical trip through the historical literature that established iodinated contrast as a leading cause for acute kidney injury, learn about the higher-quality recent studies that have challenged this dogma, and become familiar with the current consensus recommendations for how (and when) to safely give contrast to patients with decreased renal function.

OBJECTIVES & OUTCOMES

- Summarize the limitations of the historical literature that established contrast-induced AKI as a clinical entity
- Interpret recent studies that demonstrate no association between contrast administration & increased risk for AKI
- Apply current evidence & ACR-NKF consensus recommendations to achieve ideal diagnostic imaging selection on your next shift
